

1.1.14 Performance Statistics Registers

1.1.14.1 OACONTROL – Observation Architecture Control

OACONTROL – Observation Architecture Control	
Register Type: MMIO Address Offset: 2360h Project: All Default Value: 00000000h Access: R/W Size (in bits): 32	
<p>This register is used to program the OA unit.</p> <p>[DevSNB B {W/A}] If software intends to reset the OA buffer to start a new one, after clearing the Timer Enable bit, software must check to see if the head pointer in OASTATUS2 is <i>greater than</i> the tail pointer in OASTATUS1. If so software must program the head pointer to a value less than the current head pointer value. This must be done <i>before</i> the buffer becomes active again</p>	
Bit De	scription
31:12	Select Context ID Project: All Specifies the context ID of the one context that affects the performance counters. All other contexts are ignored.
11:6	Timer Period Project: All Format: Select Specifies the period of the timer strobe as a function of the minimum TIME_STAMP resolution. The period is determined by selecting a specified bit from the TIME_STAMP register as follows: $\text{StrobePeriod} = \text{MinimumTimeStampPeriod} * 2^{\text{TimerPeriod}}$ The exponent is defined by this field. Note: The TIME_STAMP is not reset at start time so the phase of the strobe is not synchronized with the enable of the OA unit. This could result in approximately a full StrobePeriod elapsing prior to the first trigger. Usage for this mechanism should be time based periodic triggering, typically.

OACONTROL – Observation Architecture Control

5	<p>Timer Enable</p> <p>Project: All</p> <p>Default Value: 0h Disabled</p> <p>Format: Enable</p> <p>This field enables the timer logic to output a periodic strobe, as defined by the Timer Period. When disabled the timer output is not asserted.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Value Na</th> <th style="width: 15%;">me</th> <th style="width: 50%;">Description</th> <th style="width: 20%;">Project</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>Disable</td> <td>Counter does not get written out on regular interval</td> <td>All</td> </tr> <tr> <td>1h</td> <td>Enable</td> <td>Counter gets written out on regular intervals, defined by the Timer Period</td> <td>All</td> </tr> </tbody> </table>	Value Na	me	Description	Project	0h	Disable	Counter does not get written out on regular interval	All	1h	Enable	Counter gets written out on regular intervals, defined by the Timer Period	All

1	<p>Specific Context Enable</p> <p>Project: All</p> <p>Default Value: 0h All contexts considered</p> <p>Mask: MMIO(0x2000)#16</p> <p>Format: U32 FormatDesc</p> <p>Enables counters to work on a context specific workload. The context is given by bits 31:12</p> <p>[DevSNB A] Must be set to '1' (context aware)</p>												

OACONTROL – Observation Architecture Control

	Value Na	me	Description	Project
	0h	Disable	All contexts are considered	All
	1h	Enable	Only the contexts with the Select Context ID are considered	All
0	Performance Counter Enable Project: All Format: Enable Global performance counter enable. If clear, no counting will occur. MI_REPORT_PERF_COUNT is undefined when clear.			

When either the MI_REPORT_PERF_COUNT command is received or the internal Report Triggering logic fires following 64 byte cache lines are written to memory. There are five formats as defined by the Counter Select within the OACONTROL word. The RPT_ID always stored in the lowest addressed DWord.

Counter Select = 000

A-Cntr 0	A-Cntr 1	A-Cntr 2	A-Cntr 3	A-Cntr 4	TIME_STAMP		RPT_ID
A-Cntr 5	A-Cntr 6	A-Cntr 7	A-Cntr 8	A-Cntr 9	A-Cntr 10	A-Cntr 11	A-Cntr 12

Counter Select = 001

A-Cntr 0	A-Cntr 1	A-Cntr 2	A-Cntr 3	A-Cntr 4	TIME_STAMP		RPT_ID

1.1.14.2 OASTATUS1 – Observation Architecture Status Register

OASTATUS1— Observation Architecture Status Register																												
Register Type: MMIO Address Offset: 2364h Project: All Default Value: 00000000h Access: R/W Size (in bits): 32																												
This register is used to program the OA unit.																												
Bit De	scription																											
31:6	Tail Ppointer Project: All Virtual address of the internal trigger based buffer and it is updated for every 64B cacheline write to memory when reporting via internal trigger. This pointer will not be updated for MI_REPORT_PERF_COUNT command based writes. When OA is enabled, this address must be programmed by SW to the base address of the internal trigger base mechanism.																											
5:3	Inter Trigger Report Buffer Size Project: All Default Value: 0h All context considered This field indicates the size of buffer for internal trigger mechanism. This field is programmed in terms of multiple of 4 pages (i.e. 16KB). <table border="1" data-bbox="300 1327 1195 1722"> <thead> <tr> <th>Value De</th> <th>scription</th> <th>Project</th> </tr> </thead> <tbody> <tr> <td>0b</td> <td>16KB</td> <td>All</td> </tr> <tr> <td>1b</td> <td>32KB</td> <td>All</td> </tr> <tr> <td>2</td> <td>48KB</td> <td>All</td> </tr> <tr> <td>3</td> <td>64KB</td> <td>All</td> </tr> <tr> <td>4</td> <td>80KB</td> <td>All</td> </tr> <tr> <td>5</td> <td>96KB</td> <td>All</td> </tr> <tr> <td>6</td> <td>112KB</td> <td>All</td> </tr> <tr> <td>7</td> <td>128KB</td> <td>All</td> </tr> </tbody> </table>	Value De	scription	Project	0b	16KB	All	1b	32KB	All	2	48KB	All	3	64KB	All	4	80KB	All	5	96KB	All	6	112KB	All	7	128KB	All
Value De	scription	Project

4	80KB	All																										
5	96KB	All																										
6	112KB	All																										
7	128KB	All																										

OASTATUS1— Observation Architecture Status Register	
2	<p>Counter OverFlow Error Project: All Format: Select</p> <p>This bit is set if any of the counters overflows. This bit can be reset by SW in B0.</p>
1	<p>Buffer Overflow</p> <p>Project: All</p> <p>Default Value: 0h</p> <p>This bit is set when the Tail-pointer - Head pointer > max internal trigger buffer size</p>
0	<p>Report Lost Error Project: All Format: Enable</p> <p>This bit is set if the Report Logic is requested to write out the counter values before the previous report request was completed. The report request is ignored and the counter continue to count. This bit can be reset by SW in B0.</p>

1.1.14.3 OASTATUS2 – Observation Architecture Status Register

OASTATUS2— Observation Architecture Status Register	
<p>Register Type: MMIO Address Offset: 2368h Project: All Default Value: 00000000h Access: RO Size (in bits): 32</p>	
This register is used to program the OA unit.	
Bit De	scription
31:6	<p>Head Pointer</p> <p>Project: All</p> <p>Virtual address of the internal trigger based buffer that is updated by software after consuming from the report buffer. This pointer must be updated by SW for internal trigger base buffer only.</p>
5:0	<p>Reserved Project: All Format: MBZ</p>

1.1.14.4 OABUFFER – Observation Architecture Buffer

OABUFFER— Observation Architecture Status Register	
Register Type: MMIO Address Offset: 23B0h Project: All Default Value: 00000000h Access: RW Size (in bits): 32	
This register is used to program the OA unit. [DevSNB A{W/A}] This offset does not exist. Instead, the value is set during the tail address MMIO write to the same data value as the tail address (0x2364). [DevSNB C+] This MMIO must be set <i>before</i> the OASTATUS1 and OASTATUS2 registers	
Bit De	scription
31:6	Report Buffer Offset Project: All This field specifies 64B aligned GFX MEM address where the chap counter values are reported.
5:0	Reserved Project: All Format: MBZ

1.1.14.5 OASTARTTRIG1 – Observation Architecture Start Trigger

OASTARTTRIG1— Observation Architecture Buffer	
Register Type: MMIO	
Address Offset: 238Ch	
Project: All	
Default Value: 00000000h	
Access: RW	
Size (in bits): 32	
This register is used to program the OA unit.	
Bit De	scription
31:16	Reserved Project: All Format: MBZ
15:0	Threshold Value Project: All Format: U16 Threshold value for the compare logic within the trigger logic

1.1.14.6 OASTARTTRIG2 – Observation Architecture Start Trigger

OASTARTTRIG2— Observation Architecture Start Trigger	
Register Type: MMIO	
Address Offset: 2388h	
Project: All	
Default Value: 00000000h	
Access: RW	
Size (in bits): 32	
This register is used to program the OA unit.	
Bit De	scription
31	event select 3, to select between Boolean and NOA event for the counter 4 to count 0 NOA 1 Boolean
30	event select 2, to select between Boolean and NOA event for the counter 3 to count 0 NOA 1 Boolean
29	event select 1, to select between Boolean and NOA event for the counter 2 to count 0 NOA 1 Boolean

OASTARTTRIG2— Observation Architecture Start Trigger

1	<p>Invert A Enable 1</p> <p>Invert the specified signal at the A stage of the trigger logic.</p>
0	<p>Invert A Enable 0</p> <p>Invert the specified signal at the A stage of the trigger logic.</p>

1.1.14.7 OASTARTTRIG3 – Observation Architecture Start Trigger

OASTARTTRIG3— Observation Architecture Start Trigger			
Register Type:	MMIO		
Address Offset:	2384h		
Project:	All		
Default Value:	00000000h		
Access:	RW		
Size (in bits):	32		
This register is used to program the OA unit.			
Bit De	scription		
31:28	NOA Signal Select 15 Select 1 of the 16 input NOA signals	Project: All	Format: U4
27:24	NOA Signal Select 14 Select 1 of the 16 input NOA signals	Project: All	Format: U4
23:20	NOA Signal Select 13 Select 1 of the 16 input NOA signals	Project: All	Format: U4
19:16	NOA Signal Select 12 Select 1 of the 16 input NOA signals	Project: All	Format: U4
15:12	NOA Signal Select 11 Select 1 of the 16 input NOA signals	Project: All	Format: U4
11:8	NOA Signal Select 10 Select 1 of the 16 input NOA signals	Project: All	Format: U4
7:4	NOA Signal Select 9 Select 1 of the 16 input NOA signals	Project: All	Format: U4
3:0	NOA Signal Select 8 Select 1 of the 16 input NOA signals	Project: All	Format: U4

1.1.14.8 OASTARTTRIG4 – Observation Architecture Start Trigger

OASTARTTRIG4— Observation Architecture Start Trigger				
Register Type: MMIO				
Address Offset: 2380h				
Project: All				
Default Value: 00000000h				
Access: RW				
Size (in bits): 32				
This register is used to program the OA unit.				
Bit De	scription			
31:28	NOA Signal Select 7 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
27:24	NOA Signal Select 6 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
23:20	NOA Signal Select 5 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
19:16	NOA Signal Select 4 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
15:12	NOA Signal Select 3 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
11:8	NOA Signal Select 2 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
7:4	NOA Signal Select 1 Select 1 of the 16 input NOA signals	Project: All	Format: U4	
3:0	NOA Signal Select 0 Select 1 of the 16 input NOA signals	Project: All	Format: U4	

1.1.14.9 OAREPORTTRIG1 – Observation Architecture Report Trigger

OAREPORTTRIG1— Observation Architecture Report Trigger			
Register Type: MMIO Address Offset: 237Ch Project: All Default Value: 00000000h Access: RW Size (in bits): 32			
This register is used to program the OA unit.			
Bit De	scription		
31:16	Occurrence vs. Duration Select		
	Project: All		
	Format: Occurrence[16]		
	1 bit per NOA counter total 16 bits		
	Value Na	me	Description
	0h	Duration	
	1h	Occurence	
15:0	Threshold Value Project: All Format: U16 Threshold value for the compare logic within the trigger logic		

1.1.14.10 OAREPORTTRIG2 – Observation Architecture Report Trigger

OAREPORTTRIG2— Observation Architecture Report Trigger	
Register Type: MMIO Address Offset: 2378h Project: All Default Value: 00000000h Access: RW Size (in bits): 32	
This register is used to program the OA unit.	
Bit De	scription
31:24	Reserved Project: All Format: MBZ
23	Threshold Enable Enable the threshold compare logic within the trigger logic.
22	Invert D Enable 0 Invert the specified signal at the D stage of the trigger logic.
21	Invert C Enable 1 Invert the specified signal at the C stage of the trigger logic.
20	Invert C Enable 0 Invert the specified signal at the C stage of the trigger logic.
19	Invert B Enable 3 Invert the specified signal at the B stage of the trigger logic.
18	Invert B Enable 2 Invert the specified signal at the B stage of the trigger logic.
17	Invert B Enable 1 Invert the specified signal at the B stage of the trigger logic.
16	Invert B Enable 0 Invert the specified signal at the B stage of the trigger logic.
15	Invert A Enable 15 Invert the specified signal at the A stage of the trigger logic.

OAREPORTTRIG2— Observation Architecture Report Trigger

14	Invert A Enable 14 Invert the specified signal at the A stage of the trigger logic.
13	Invert A Enable 13 Invert the specified signal at the A stage of the trigger logic.
12	Invert A Enable 12 Invert the specified signal at the A stage of the trigger logic.
11	Invert A Enable 11 Invert the specified signal at the A stage of the trigger logic.
10	Invert A Enable 10 Invert the specified signal at the A stage of the trigger logic.
9	Invert A Enable 9 Invert the specified signal at the A stage of the trigger logic.
8	Invert A Enable 8 Invert the specified signal at the A stage of the trigger logic.
7	Invert A Enable 7 Invert the specified signal at the A stage of the trigger logic.
6	Invert A Enable 6 Invert the specified signal at the A stage of the trigger logic.
5	Invert A Enable 5 Invert the specified signal at the A stage of the trigger logic.
4	Invert A Enable 4 Invert the specified signal at the A stage of the trigger logic.
3	Invert A Enable 3 Invert the specified signal at the A stage of the trigger logic.
2	Invert A Enable 2 Invert the specified signal at the A stage of the trigger logic.

OAREPORTTRIG2— Observation Architecture Report Trigger

1	Invert A Enable 1 Invert the specified signal at the A stage of the trigger logic.
0	Invert A Enable 0 Invert the specified signal at the A stage of the trigger logic.

1.1.14.11 OAREPORTTRIG3 – Observation Architecture Report Trigger

OAREPORTTRIG3— Observation Architecture Report Trigger

Register Type: MMIO
Address Offset: 2374h
Project: All
Default Value: 00000000h
Access: RW
Size (in bits): 32

This register is used to program the OA unit.

Bit De	scription
31:28	NOA Signal Select 15 Project: All Format: U4 Select 1 of the 16 input NOA signals
27:24	NOA Signal Select 14 Project: All Format: U4 Select 1 of the 16 input NOA signals
23:20	NOA Signal Select 13 Project: All Format: U4 Select 1 of the 16 input NOA signals
19:16	NOA Signal Select 12 Project: All Format: U4 Select 1 of the 16 input NOA signals
15:12	NOA Signal Select 11 Project: All Format: U4 Select 1 of the 16 input NOA signals
11:8	NOA Signal Select 10 Project: All Format: U4 Select 1 of the 16 input NOA signals
7:4	NOA Signal Select 9 Project: All Format: U4 Select 1 of the 16 input NOA signals
3:0	NOA Signal Select 8 Project: All Format: U4 Select 1 of the 16 input NOA signals

1.1.14.12 OAREPORTTRIG4 – Observation Architecture Report Trigger

OAREPORTTRIG4— Observation Architecture Report Trigger			
Register Type: MMIO			
Address Offset: 2370h			
Project: All			
Default Value: 00000000h			
Access: RW			
Size (in bits): 32			
This register is used to program the OA unit.			
Bit De	scription		
31:28	NOA Signal Select 7 Select 1 of the 16 input NOA signals	Project: All	Format: U4
27:24	NOA Signal Select 6 Select 1 of the 16 input NOA signals	Project: All	Format: U4
23:20	NOA Signal Select 5 Select 1 of the 16 input NOA signals	Project: All	Format: U4
19:16	NOA Signal Select 4 Select 1 of the 16 input NOA signals	Project: All	Format: U4
15:12	NOA Signal Select 3 Select 1 of the 16 input NOA signals	Project: All	Format: U4
11:8	NOA Signal Select 2 Select 1 of the 16 input NOA signals	Project: All	Format: U4
7:4	NOA Signal Select 1 Select 1 of the 16 input NOA signals	Project: All	Format: U4
3:0	NOA Signal Select 0 Select 1 of the 16 input NOA signals	Project: All	Format: U4

1.1.14.13 CEC0-0 – Customizable Event Creation

CEC0-0— Customizable Event Creation			
Register Type: MMIO Address Offset: 2390h Project: All Default Value: 00000000h Access: Write Only Size (in bits): 32			
This register is used to program the OA unit.			
Bit De	scription		
31:21	Reserved	Project: [DevSNB]	Format: MBZ
20:19	Clock Domain Project: DevSNB Format: U2 Selects clock domains for DELAY flops and BOOLEAN EVENT flops. The encoding of this field is device specific.

1.1.14.14 CEC0-1 – Customizable Event Creation

CEC0-1— Customizable Event Creation	
Register Type: MMIO Address Offset: 2394h Project: All Default Value: 00000000h Access: Write Only Size (in bits): 32	
This register is used to program the OA unit.	
Bit De	scription
31:16	Considerations Project: All Format: U32 Bit field LSB corresponds to NOA bit 0. 0: The NOA bit is considered in event calculations. 1: The NOA bit is delayed by 1 clock before considering it in event calculations. This is particularly useful for doing state machine arc coverage. For example, NOA bits 3:0 and NOA 7:4 could be programmed to the same 4 present state, state machine signals. The appropriate inversion selections would be made depending on which state transition is of interest. Bits 31:28 in the delay selection would be programmed to "1111", indicating use a pipe delayed version of the state signals. The resulting "AND" of the now preconditioned NOA 7:4 and NOA 3:0 signals would indicate the number of times the arc of interest was taken. This could be recorded with the CHAP counters.
15:0	Mask Project: All Format: U32 Bit field LSB corresponds to NOA bit 0. These 8 bits are used to mask off entries from the comparison. For each bit: 0: This NOA bit is considered in event calculations. 1: This NOA bit is ignored in event calculations.

1.1.15 Frame Buffer Compression Control ([DevCL] Only)

This section describes the registers associated with the Frame Buffer Compression function. The primary motivation of FBC is power savings and thus it is only applicable to the Mobile Product.

Programming Notes:

- Frame buffer compression has to be disabled (via FBC_CONTROL[31] = 0), and software has to wait until compression not in progress (FBC_STATUS[31] == 0) before changing any of the following fields:
 - FBC_CFB_BASE
 - FBC_LL_BASE
 - FBC_CONTROL[Mode Select]
 - FBC_CONTROL[Compressed Frame Buffer Stride]
 - FBC_CONTROL[Fence Number]

1.1.15.1 FBC_CFB_BASE — Compressed Frame Buffer Base Address

FBC_CFB_BASE — Compressed Frame Buffer Base Address					
Register Type: MMIO Address Offset: 3200h Project: DevCL Default Value: 0000 0000h Access: R/W Size (in bits): 32					
This register specifies the physical memory address at which the Compressed Frame Buffer is located. Note that the Compressed Frame Buffers must be in Non Cacheable memory and not relocated while FBC is active.					
Bit De	scription				
31:12	Compressed Frame Buffer Address Project: DevCL Default Value: 0h Address: PhysicalAddress[31:12] This register specifies Bits 31:12 of the physical address of the Compressed Frame Buffer. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th colspan="2" style="text-align: left;">Programming Notes</th> </tr> </thead> <tbody> <tr> <td colspan="2">Software must guarantee that the Compressed Frame Buffer is stored in contiguous physical memory. The buffer must be 4K byte aligned. This field should not be changed unless FBC is inactive (the first VBlank start after Enable Frame Buffer Compression has been cleared.)</td> </tr> </tbody> </table>	Programming Notes		Software must guarantee that the Compressed Frame Buffer is stored in contiguous physical memory. The buffer must be 4K byte aligned. This field should not be changed unless FBC is inactive (the first VBlank start after Enable Frame Buffer Compression has been cleared.)	
Programming Notes					
Software must guarantee that the Compressed Frame Buffer is stored in contiguous physical memory. The buffer must be 4K byte aligned. This field should not be changed unless FBC is inactive (the first VBlank start after Enable Frame Buffer Compression has been cleared.)					
11:0	Reserved Project: DevCL Format: MBZ				

1.1.15.2 FBC_LL_BASE — Compressed Frame Line Length Buffer Address

FBC_LL_BASE — Compressed Frame Line Length Buffer Address			
Register Type: MMIO Address Offset: 3204h Project: DevCL Default Value: 0000 0000h Access: R/W Size (in bits): 32			
This register specifies the physical memory address at which the Compressed Frame Line Length Buffer is located. Note that the Compressed Frame Buffers must be in Non Cacheable memory and not relocated while FBC is active.			
Bit De	scription		
31:12	Compressed Frame Line Length Buffer Address Project: DevCL Default Value: 0h Address: PhysicalAddress[31:12] This register specifies Bits 31:12 of the physical address of the Compressed Frame Line Length Buffer. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Programming Notes</th> </tr> </thead> <tbody> <tr> <td>Software must guarantee that the Compressed Frame Line Length Buffer is stored in contiguous physical memory. The buffer must be 4K byte aligned. This field should not be changed unless FBC is inactive (the first VBlank start after Enable Frame Buffer Compression has been cleared.)</td> </tr> </tbody> </table>	Programming Notes	Software must guarantee that the Compressed Frame Line Length Buffer is stored in contiguous physical memory. The buffer must be 4K byte aligned. This field should not be changed unless FBC is inactive (the first VBlank start after Enable Frame Buffer Compression has been cleared.)
Programming Notes			
Software must guarantee that the Compressed Frame Line Length Buffer is stored in contiguous physical memory. The buffer must be 4K byte aligned. This field should not be changed unless FBC is inactive (the first VBlank start after Enable Frame Buffer Compression has been cleared.)			
11:0	Reserved Project: DevCL Format: MBZ		

1.1.15.3 FBC_CONTROL — Frame Buffer Compression Control Register

FBC_CONTROL — Frame Buffer Compression Control Register													
Register Type: MMIO Address Offset: 3208h Project: DevCL Default Value: 0000 0000h Access: R/W Size (in bits): 32													
This register is used to control the operation of RLE-FBC.													
Bit De	scription												
31	Enable Frame Buffer Compression Project: DevCL Default Value: 0h Format: Enable This bit is used to globally enable or disable the RLE-FBC function (compression and decompression) at the next VBlank start. <table border="1"> <thead> <tr> <th>Value Na</th> <th>me</th> <th>Description</th> <th>Project</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>Disable</td> <td>Disable frame buffer compression.</td> <td>DevCL</td> </tr> <tr> <td>1h</td> <td>Enable</td> <td>Enable frame buffer compression.</td> <td>DevCL</td> </tr> </tbody> </table>	Value Na	me	Description	Project	0h	Disable	Disable frame buffer compression.	DevCL	1h	Enable	Enable frame buffer compression.	DevCL
Value Na	me	Description	Project										
0h	Disable	Disable frame buffer compression.	DevCL										
1h	Enable	Enable frame buffer compression.	DevCL										
30	Mode Select Project: DevCL Default Value: 0h Format: U1 <table border="1"> <thead> <tr> <th>Value Na</th> <th>me</th> <th>Description</th> <th>Project</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>Single Pass</td> <td>Single Pass mode</td> <td>DevCL</td> </tr> <tr> <td>1h</td> <td>Periodic Pass</td> <td>Periodic mode</td> <td>DevCL</td> </tr> </tbody> </table>	Value Na	me	Description	Project	0h	Single Pass	Single Pass mode	DevCL	1h	Periodic Pass	Periodic mode	DevCL
Value Na	me	Description	Project										
0h	Single Pass	Single Pass mode	DevCL										
1h	Periodic Pass	Periodic mode	DevCL										
29:16	Interval Project: DevCL Default Value: 0h Format: U14 Range [1,16383] This is interval for which the compressor waits between passes. In Periodic Mode this field determines the interval length, in terms of frames (VBlanks). Zero is an illegal value.												

FBC_CONTROL — Frame Buffer Compression Control Register					
15	Stop Compressing on Modification (DEBUG ONLY) If set to '1' the compressor will abort a subsequent compressing pass when any modification to the source frame buffer is detected.	Project:	DevCL	Format:	Enable
14	Uncompressible Enable If set to a '1' the compressor marks as "Uncompressible 10" (see the FBC_TAG register) if any scanline in a pair cannot be compressed. In Default mode Uncompressible mode is turned off.	Project:	DevCL	Format:	Enable
13	Reserved	Project:	DevCL	Format:	MBZ
12:5	Compressed Frame Buffer Stride This is the stride for the compressed frame buffer. This value is used to determine the line-to-line increment for the compressed frame buffer. Lines that cannot be compressed to a stride size or less are not compressed at all. This field must be set to a value less than or equal to the stride of the source (uncompressed) frame buffer. 00h = 64B stride	Project:	DevCL	Format:	(Stride in 64Byte units) – 1
4	Reserved	Project:	DevCL	Format:	MBZ
3:0	Fence Number This field specifies the FENCE number corresponding to the placement of the uncompressed frame buffer. (Note that only tiled frame buffers can be compressed). This field is double buffered in hardware. Only the host accesses the uncompressed frame buffer using a fence.	Project:	DevCL	Format:	U3

1.1.15.4 FBC_COMMAND — Frame Buffer Compression Command Register

FBC_COMMAND — Frame Buffer Compression Command Register					
Register Type: MMIO					
Address Offset: 320Ch					
Project: DevCL					
Default Value: 0000 0000h					
Access: R/W					
Size (in bits): 32					
This register is used to request a frame buffer compression pass while in Single Pass mode.					
Bit De	scription				
31:1	Reserved	Project:	DevCL	Format:	MBZ
0	Compress Enable Software can set this bit to trigger compression in Single Pass mode. The compressor clears this bit after the compression pass is completed. This bit is ignored in Periodic Mode (i.e., it will not cause a compression pass and will always read as '0').	Project:	DevCL	Format:	Enable

1.1.15.5 FBC_STATUS — Frame Buffer Compression Status Register

FBC_STATUS — Frame Buffer Compression Status Register	
Register Type: MMIO Address Offset: 3210h Project: DevCL Default Value: 2000 0000h Access: RO / R/W Size (in bits): 32	
This register contains status information associated with the RLE-FBC function. The information is read-only in normal operation, though some fields can be programmed as a TEST MODE.	
Bit De	scription
31	Compressing Project: DevCL Security: RO Default Value: 0h Format: Flag This status bit indicates that the device is currently within a compression pass.
30	Compressed Project: DevCL Security: RO normally, R/W TEST MODE Default Value: 0h Format: Flag This bit indicates that a compressed frame buffer is available at the address contained in the FB_CFB_BASE register. In normal operation the compressor sets this bit when it has completed the compression pass. During compression this bit is not set. As a test mode this bit can be set if there is a software-created compressed buffer available at the address in the FB_CFB_BASE register. <u>Test-Mode software must check that compression is not in progress before setting this bit.</u> If RLE-FBC is enabled, the compressor will clear this bit when it starts the next recompression pass.

FBC_STATUS — Frame Buffer Compression Status Register

29	<p>Any Modified</p> <p>Project: DevCL</p> <p>Security: RO normally, R/W TEST MODE</p> <p>Default Value: 1h</p> <p>Format: Flag</p> <p>1 = (default) Indicates that the frame buffer has been modified since the last compression pass. The compressor sets this bit on the first write to the frame buffer from the application/driver or upon an allocation within the render cache (e.g., as a result of Blt, 3D or MPEG activity). The fence number and frame buffer base address are used to determine if a write modified the frame buffer. The bit is cleared by the compressor at the start of the next compression pass.</p> <p>In normal operation this bit is read only (software must not write this bit) and defaults to a “1”.</p> <p>As a test mode this bit can be set if there is a software-created compressed buffer with modified lines available at the address contained the FB_CFB_BASE register. <u>SW must check that compression is not in progress before setting this bit.</u> If enabled, the compressor will clear this bit when it initiates the next compression pass. This test mode is used for continuous-mode compression testing.</p>
28:11	<p>Reserved Project: DevCL Format: MBZ</p>
10:0	<p>Current Line Compressing</p> <p>Project: DevCL</p> <p>Security: RO</p> <p>Default Value: 0h</p> <p>Format: U11</p> <p>This read only field indicates the line number that the compressor is currently processing.</p> <p>If this field is 0 and the Compressing bit (Bit 31) is set, the compressor is currently on display frame line 1.</p>

1.1.15.8 FBC_MOD_NUM— FBC Number of Modifications for Recompression

FBC_MOD_NUM— FBC Number of Modifications for Recompression	
Register Type: MMIO Address Offset: 3220h Project: DevCL Default Value: 0000 0000h Access: R/W Size (in bits): 32 Trusted Type: 1	
The purpose of this register is to avoid SR exit unless the programmed number of modifications have been made to the Display buffer.	
Bit De	scription
31:1	FBC_Mod_Num Project: DevCL Format: U12 Number of modifications to the display buffer required before recompression is attempted. If the number of modifications to the Frame Buffer is not equal to the programmed count value at the end of the interval, re-compression is not attempted.
0	FBC_Mod_Num_Valid Project: DevCL Format: Flag Only if this bit is set will the above count value be looked at.

1.1.15.9 FBC_TAG — Frame Buffer Compression TAG Interface (DEBUG)

FBC_TAG — Frame Buffer Compression TAG Interface (DEBUG)	
Register Type: MMIO Address Offset: 3300h Project: All Default Value: 00000000h; Access: R/W Size (in bits): 49x32 Trusted Type: 1	
The device implements 49 DWords of Tag data for RLE-FBC compression. Each DWord contains storage for a 2-bit Tag value associated with a frame buffer line pair.	
49 DWords are required to support the required 1536 display lines (= 48 x 32), as an extra DWord may be required due to the alignment of the source (uncompressed) frame buffer. I.e., if the source frame buffer starts on an odd tile line, line 0 corresponds to bit 1 of 3300 (bit 0 is unused) and the 49 th DWord may be required. If the source frame buffer starts on an even tile line, line 0 corresponds to bit 0 of 3300.	

FBC_TAG — Frame Buffer Compression TAG Interface (DEBUG)

		11	Compressed	The associated lines are compressed	All

1.2 Fence Registers

1.2.1 FENCE — Graphics Memory Fence Table Registers

FENCE — Graphics Memory Fence Table Registers	
Register Type:	MMIO
Address Offset:	3000h
Project:	All
Default Value:	00000000h;
Access:	R/W
Size (in bits):	16x64
Trusted Type:	1
Address Offset:	03000h – 03007h: FENCE_0 : : 0307Ch – 0307Fh: FENCE_15
<p>The graphics device performs address translation from linear space to tiled space for a CPU access to graphics memory (See <i>Memory Interface Functions</i> chapter for information on these memory layouts) using the fence registers. Note that the fence registers are used only for CPU accesses to gfx memory. Graphics rendering/display pipelines use Per Surface Tiling (PST) parameters (found in SURFACE_STATE – see the <i>Sampling Engine</i> chapter) to access tiled gfx memory.</p> <p>The intent of tiling is to locate graphics data that are close (in X and Y surface axes) in one physical memory page while still locating some amount of line oriented data sequentially in memory for display efficiency. All 3D rendering is done such that the QWords of any one span are all located in the same memory page, improving rendering performance. Applications view surfaces as linear, hence when the cpu access a surface that is tiled, the gfx hardware must perform linear to tiled address conversion and access the correct physical memory location(s) to get the data.</p> <p>Tiled memory is supported for rendering and display surfaces located in graphics memory. A tiled memory surface is a surface that has a width and height that are subsets of the tiled region’s pitch and height. The device maintains the constants required by the memory interface to perform the address translations. Each tiled region can have a different pitch and size. The CPU-memory interface needs the surface pitch and tile height to perform the address translation. It uses the GMAddr (PCI-BAR) offset address to compare with the fence start and end address, to determine if the rendering surface is tiled. The tiled address is generated based on the tile orientation determined from the matching fence register. Fence ranges are at least 4 KB aligned. Note that the fence registers are used <u>only for CPU accesses</u> to graphics memory.</p> <p>A Tile represents 4 KB of memory. Tile height is 8 rows for X major tiles and 32 rows for Y major tiles. Tile Pitch is 512Bs for X major tiles and 128Bs for Y major tiles. The surface pitch is programmed in 128B units such that the pitch is an integer multiple of “tile pitch”.</p> <p>Engine restrictions on tile surface usage are detailed in Surface Placement Restrictions (Memory Interface Functions). Note that X major tiles can be used for Sampler, Color, Depth, motion compensation references and motion compensation destination, Display, Overlay, GDI Blt source and destination surfaces. Y major tiles can be used for Sampler, depth, color and motion compensation assuming they do not need to be displayed. GDI Blit operations, overlay and display cannot used Tiled Y orientations.</p> <p>A “PST” graphics surface that will also be accessed via fence needs its base address to be tile row aligned.</p>	

FENCE — Graphics Memory Fence Table Registers

Hardware handles the flushing of any pending cycles when software changes the fence upper/lower bounds.

Fence Table Registers occupy the address range specified above. Each Fence Table Register has the following format.

FENCE registers are *not* reset by a graphics reset. They will maintain their values unless a full chipset reset is performed.

DWord Bit	Description								
0..15	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%; text-align: center;">63:44</td> <td> <p>Fence Upper Bound</p> <p>Project: All</p> <p>Address: GraphicsAddress[31:12]</p> <p>Bits 31:12 of the ending Graphics Address of the fence region. 1.3 Memory Interface Commands for Rendering Engine

1.3.1 Introduction

This chapter describes the formats of the “Memory Interface” commands, including brief descriptions of their use. The functions performed by these commands are discussed fully in the *Memory Interface Functions* Device Programming Environment chapter.

This chapter describes MI Commands for the original graphics processing engine. The term “for Rendering Engine” in the title has been added to differentiate this chapter from a similar one describing the MI commands for the Media Decode Engine.

The commands detailed in this chapter are used across products within the Gen4+ family. However, slight changes may be present in some commands (i.e., for features added or removed), or some commands may be removed entirely.

1.3.2 Software Synchronization Commands

To support mid-triangle interruption, certain commands need to be placed in a temporary location in hardware until primitive commands are complete. This introduces out-of-order command execution. Below show the commands that are affected. Note that the INSTPM register has a bit that is used to force in-order execution.

Command	Qualifications
MI_NOOP	When writing to the NOOPID register
MI_USER_INTERRUPT	Always
MI_PROBE	Writing out new value after check
MI_UNPROBE	Always
MI_SEMAPHORE_MBOX	Memory write
MI_STORE_DATA_IMM	Always
MI_STORE_DATA_INDEX	Always
MI_LOAD_REGISTER_IMM	Always
MI_UPDATE_GTT	Always
MI_STORE_REGISTER_MEM	Register read is done in-order, register write done out-of-order

1.3.3 MI_ARB_CHECK

MI_ARB_CHECK		
Project:	All	Length Bias: 1
Engine:	Render	
<p>The MI_ARB_CHECK instruction is used to check the ring buffer double buffered head pointer (register UHPTR). This instruction can be used to pre-empt the current execution of the ring buffer. Note that the valid bit in the updated head pointer register needs to be set for the command streamer to be pre-empted.</p> <p>Programming Note:</p> <ul style="list-style-type: none"> • The current head pointer is loaded with the updated head pointer register independent of the location of the updated head • If the current head pointer and the updated head pointer register are equal, hardware will automatically reset the valid bit corresponding to the UHPTR • For Gen6 this instruction can be placed only in a ring buffer, never in a batch buffer. For Gen7+ it can be in either a ring buffer or batch buffer. • For pre-emption, the wrap count in the ring buffer head register is no longer maintained by hardware. The hardware updates the wrap count to the value in the UHPTR register. 		
DWord	Bit	Description
0	31:29	Command Type Default Value: 0h MI_COMMAND Format: OpCode
	28:23	MI Command Opcode Default Value: 05h MI_ARB_CHECK Format: OpCode
	22:0	Reserved Project: All Format: MBZ

1.3.4 MI_BATCH_BUFFER_END

MI_BATCH_BUFFER_END		
Project:	All	Length Bias: 1
Engine:	Render	
<p>The MI_BATCH_BUFFER_END command is used to terminate the execution of commands stored in a <i>batch buffer</i> initiated using a MI_BATCH_BUFFER_START command.</p>		
DWord Bit		Description
0	31:29	Command Type Default Value: 0h MI_COMMAND Format: OpCode
	28:23	MI Command Opcode Default Value: 0Ah MI_BATCH_BUFFER_END Format: OpCode
	22:0	Reserved Project: All Format: MBZ
1	31:0	Semaphore Data Dword Data dword to compare memory. The Data dword is supplied by software to control execution of the command buffer. If the compare is enabled and the data at Semaphore Address is greater than this dword, the execution of the command buffer should continue.
2	31:3	Semaphore Address Qword address to fetch Data Dword(DW0) from memory. HW will compare the Data Dword(DW0) with Semaphore Data Dword
	2:0	Reserved Project: All Format: MBZ

1.3.5 MI_BATCH_BUFFER_START

MI_BATCH_BUFFER_START		
Project:	All	Length Bias: 2
Engine:	Render	
<p>The MI_BATCH_BUFFER_START command is used to initiate the execution of commands stored in a <i>batch buffer</i>. For restrictions on the location of batch buffers, see Batch Buffers in the Device Programming Interface chapter of <i>MI Functions</i>.</p> <p>Programming Notes:</p> <ul style="list-style-type: none"> • Batch buffers referenced with physical addresses must not extend beyond the end of the starting physical page (can't span physical pages). However, a batch buffer initiated using a physical address can chain to another buffer in another physical page. • A batch buffer initiated with this command must end either with a MI_BATCH_BUFFER_END command or by chaining to another batch buffer with an MI_BATCH_BUFFER_START command. • For virtual batch buffers, it is essential that the address location beyond the current page be populated inside the GTT. HW performs over-fetch of the command addresses and any over-fetch requires a valid TLB entry. A single extra page beyond the batch buffer is sufficient. • Prior to sending batch buffer start command with clear command buffer enable set, software has to ensure pipe is flushed explicitly by sending MI_FLUSH or PIPE_CONTROL with CS Stall set.. • The dword following this command in the batch buffer should always be MI_NOOP. 		
DWord Bit	Description	
0	31:29	Command Type Default Value: 0h MI_COMMAND Format: OpCode
	28:23	MI Command Opcode Default Value: 31h MI_BATCH_BUFFER_START Format: OpCode
	22:13	Reserved Project: All Format: MBZ
	12	Batch Buffer Encrypted Memory Read Enable Project: All Format: U1 The Command Streamer will request batch buffer data from serpent memory if this bit is enabled. If disabled then the batch buffer will be fetched from non-encrypted memory. Commands in the Table 3-7 Priviledged Commands are not allowed from Encrypted Batch Buffers and will be turned into NOOP commands in the command streamer. Any write that is generated from the encrypted batch buffer will write encrypted data.
	11	Clear Command Buffer Enable Project: All Format: U1 The following batch buffer is to be executed from the Write Once protected memory area. The address of the batch buffer is an offset into the WOPCM area. This batch buffer needs to be pre-ceded by a MI_FLUSH command or PIPE_CONTROL with CS Stall set.
10:9	Reserved Project: All Format: MBZ	

MI_BATCH_BUFFER_START									
	8	Buffer Security and Address Space Indicator Project: All Format: MI_BufferSecurityType When this command is executed directly from a ring buffer, this field is used to specify the associated batch buffer as a <i>secure</i> or <i>non-secure</i> buffer. Certain operations (e.g., MI_STORE_DATA_IMM commands to privileged memory) are prohibited within non-secure buffers. See Batch Buffer Protection in the Device Programming Interface chapter of <i>MI Functions</i> . When this command is executed from within a batch buffer (i.e., is a “chained” batch buffer command), this field is IGNORED and the next buffer in the chain inherits the initial buffer’s security characteristics.							
		<table border="1"> <thead> <tr> <th>Value Name</th> <th>Description</th> <th>Project</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>MI_BUFFER_SECURE</td> <td>This batch buffer is secure and will be accessed via the GGTT.</td> </tr> </tbody> </table>	Value Name	Description	Project	0h	MI_BUFFER_SECURE	This batch buffer is secure and will be accessed via the GGTT.	
	Value Name	Description	Project						
	0h	MI_BUFFER_SECURE	This batch buffer is secure and will be accessed via the GGTT.

Errata Description	Project								
# Desc	All								
	7:0	DWord Length Default Value: 0h Excludes DWord (0,1) Format: =n Total - Bias							
1	31:2	Batch Buffer Start Address Project: All Address: GraphicsAddress[31:2] Surface Type: BatchBuffer This field specifies Bits 31:2 of the starting address of the batch buffer.							
	1:0	Reserved Project: All Format: MBZ							

1.3.5.1 Command Access of Privileged Memory

Memory space mapped through the global GTT is considered “privileged” memory. Commands that have the capability of accessing both privileged and unprivileged (PPGTT space) memory will contain a bit that, if set, will attempt a “privileged” access through the GGTT rather than an unprivileged access through the context-local PPGTT.

“User mode” command buffers should not be able to access privileged memory under any circumstances. These command buffers will be issued by the kernel mode driver with the batch buffer’s **Buffer Security** Indicator set to “non-secure”. Commands in such a batch buffer are not allowed to access privileged memory. The commands in these buffers are supplied by the user mode driver and will not be validated by the kernel mode driver.

“Kernel mode” command buffers are allowed to access privileged memory. The batch buffers Buffer Security indicator is set to “secure” in this case. In some of the commands that access memory in a secure batch buffer, a bit is provided in the command to steer the access to Per process or Global virtual space. Secure batch buffers are executed from the global GTT.

Commands in ring buffers and commands in batch buffers that are marked as secure (by the kernel mode driver) are allowed to access both privileged and unprivileged memory and may choose on a command-by-command basis.

Table 1. GGTT and PPGTT Usage by Command

Command	Address	Allowed Access
MI_BATCH_BUFFER_START*	Command Address	Selectable
MI_DISPLAY_FLIP	Display Buffer Base	GGTT Only
MI_STORE_DATA_IMM*	Storage Address	Selectable
MI_STORE_DATA_INDEX**	Storage Offset	Selectable
MI_STORE_REGISTER_MEM*	Storage Address	Selectable
MI_SEMAPHORE_MBOX	Semaphore Address	Selectable
PIPE_CONTROL	STDW Address	Selectable

*Command has a GGTT/PPGTT selector added to it vs. previous Gen4 family products.

**Added bit allows offset to apply to global HW Status Page or PP HW Status Page found in context image.

1.3.5.2 Privileged Commands

A subset of the commands are privileged. These commands may be issued only from a secure batch buffer or directly from a ring. If one of these commands is parsed in a non-secure batch buffer, an error is flagged and the command is dropped. For commands that generates a write, the hardware will complete the transaction but the byte enables are turned off. Batch buffers from the User mode driver are passed directly to the kernel mode driver which does not validate them but issues them with the Security Indicator set to ‘non-secure’ to protect the system from an attack using these privileged commands.

Table 2. Privileged Commands

Privileged Command	Function in non-privileged batch buffers
MI_LOAD_REGISTER_IMM	Byte enables are turned off
MI_UPDATE_GTT	Byte enabled are turned off
MI_STORE_REGISTER_MEM	Command is translated and completed with byte enables turned off
MI_DISPLAY_FLIP	Command is ignored by the hardware

Command privilege applies the same way in Basic Scheduler mode. Parsing one of the commands in the table above from a non-secure batch buffer will flag an error and convert the command to a NOOP.

1.3.5.3 Privileged Commands [PreDevSNB]

A subset of the commands are privileged. These commands may be issued only from a secure batch buffer or directly from a ring. If one of these commands is parsed in a non-secure batch buffer, an error is flagged and the command is dropped. For commands that generates a write, the hardware will complete the transaction but the byte enables are turned off. Batch buffers from the User mode driver are passed directly to the kernel mode driver which does not validate them but issues them with the Security Indicator set to 'non-secure' to protect the system from an attack using these privileged commands.

Table 3. Privileged Commands

Privileged Command	Function in non-privileged batch buffers
MI_LOAD_REGISTER_IMM	Byte enables are turned off
MI_UPDATE_GTT	Byte enabled are turned off
MI_STORE_REGISTER_MEM	Command is translated and completed with byte enables turned off
MI_DISPLAY_FLIP	Command is ignored by the hardware

Command privilege applies the same way in Basic Scheduler mode. Parsing one of the commands in the table above from a non-secure batch buffer will flag an error and convert the command to a NOOP.

1.3.6 MI_DISPLAY_FLIP

MI_DISPLAY_FLIP		
Project:	All	Length Bias: 2
Engine:	Render	
<p>The MI_DISPLAY_FLIP command is used to request a specific display plane to switch (flip) to display a new buffer. The buffer is specified with a starting address and pitch. The tiled attribute of the buffer start address is programmed as part of the packet. This command is specific to the render engine</p> <p>The operation this command performs is also known as a “display flip request” operation – in that the flip operation itself will occur at some point in the future. This command specifies when the flip operation is to occur: either synchronously with vertical retrace to avoid tearing artifacts (possibly on a future frame), or asynchronously (as soon as possible) to minimize rendering stalls at the cost of tearing artifacts.</p> <p>Programming Notes:</p> <ol style="list-style-type: none">1. This command simply requests a display flip operation -- command execution then continues normally. There is no guarantee that the flip (even if asynchronous) will occur prior to subsequent commands being executed. (Note that completion of the MI_FLUSH command does not guarantee that outstanding flip operations have completed). The MI_WAIT_FOR_EVENT command can be used to provide this synchronization – by pausing command execution until a pending flip has actually completed. This synchronization can also be performed by use of the Display Flip Pending hardware status. See Display Flip Synchronization in the Device Programming Interface chapter of <i>MI Functions</i>.2. After a display flip operation is requested, software is responsible for initiating any required synchronization with subsequent buffer clear or rendering operations. For multi-buffering (e.g., double buffering) operations, this will typically require updating SURFACE_STATE or the binding table to change the rendering (back) buffer. In addition, prior to any subsequent clear or rendering operations, software must typically ensure that the new rendering buffer is not actively being displayed. Again, the MI_WAIT_FOR_EVENT command or Display Flip Pending hardware status can be used to provide this synchronization. See Display Flip Synchronization in the Device Programming Interface chapter of <i>MI Functions</i>.3. The display buffer command uses the X and Y offset for the tiled buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For tiled buffers, the display subsystem uses the X and Y offset in generation of the final request to memory. The offset is always updated on the next vblank for both Synchronous and Asynch Flips. It is not necessary to have a flip enqueued to update the X and Y offset4. The display buffer command uses the linear dword offset for the linear buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For linear buffers, the display subsystem uses the dword offset in generation of the final request to memory.<ul style="list-style-type: none">• For synchronous flips the offset is updated on the next vblank. It is not necessary to have a sync flip enqueued to update the dword offset.• Linear memory does not support asynchronous flips5. DWord 3 (panel fitter flip) must not be sent with asynchronous flips. It is only allowed to be sent with synchronous flips.		

MI_DISPLAY_FLIP

	7:0	DWord Length Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:16	Reserved Project: All Format: MBZ
	15:6	Display Buffer Pitch Project: All Default Value: 0h DefaultVaueDesc Format: U10 <i>For Synchronous Flips only</i> , this field specifies the 64-byte aligned pitch of the new display buffer. For Asynchronous Flips, this parameter is programmed so that all the flips in a flip chain should maintain the same pitch as programmed with the last synchronous flip or direct thru mmio.
	5:1	Reserved Project: All Format: MBZ

Project: All
Engine: Render

Length Bias: | 2

The MI_DISPLAY_FLIP command is used to request a specific display plane to switch (flip) to display a new buffer. The buffer is specified with a starting address and pitch. The tiled attribute of the buffer start address is programmed as part of the packet. This command is specific to the render engine

The operation this command performs is also known as a “display flip request” operation – in that the flip operation itself will occur at some point in the future. This command specifies when the flip operation is to occur: either synchronously with vertical retrace to avoid tearing artifacts (possibly on a future frame), or asynchronously (as soon as possible) to minimize rendering stalls at the cost of tearing artifacts.

Programming Notes:

6. This command simply requests a display flip operation -- command execution then continues normally. There is no guarantee that the flip (even if asynchronous) will occur prior to subsequent commands being executed. (Note that completion of the MI_FLUSH command does not guarantee that outstanding flip operations have completed). The MI_WAIT_FOR_EVENT command can be used to provide this synchronization – by pausing command execution until a pending flip has actually completed. This synchronization can also be performed by use of the Display Flip Pending hardware status. See Display Flip Synchronization in the Device Programming Interface chapter of *MI Functions*.
7. After a display flip operation is requested, software is responsible for initiating any required synchronization with subsequent buffer clear or rendering operations. For multi-buffering (e.g., double buffering) operations, this will typically require updating SURFACE_STATE or the binding table to change the rendering (back) buffer. In addition, prior to any subsequent clear or rendering operations, software must typically ensure that the new rendering buffer is not actively being displayed. Again, the MI_WAIT_FOR_EVENT command or Display Flip Pending hardware status can be used to provide this synchronization. See Display Flip Synchronization in the Device Programming Interface chapter of *MI Functions*.
8. The display buffer command uses the X and Y offset for the tiled buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For tiled buffers, the display subsystem uses the X and Y offset in generation of the final request to memory. The offset is always updated on the next vblank for both Synchronous and Asynch Flips. It is not necessary to have a flip enqueued to update the X and Y offset
9. The display buffer command uses the linear dword offset for the linear buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For linear buffers, the display subsystem uses the dword offset in generation of the final request to memory.
 - For synchronous flips the offset is updated on the next vblank. It is not necessary to have a sync flip enqueued to update the dword offset.
 - Linear memory does not support asynchronous flips
10. DWord 3 (panel fitter flip) must not be sent with asynchronous flips. It is only allowed to be sent with synchronous flips.

1.3.7 MI_FLUSH

MI_FLUSH	
Project:	All
Engine:	Render
Length Bias:	1
<p>The MI_FLUSH command is used to perform an internal “flush” operation. The parser pauses on an internal flush until all drawing engines have completed any pending operations and the read caches are invalidated including the texture cache accessed via the Sampler or the data port. In addition, this command can also be used to:</p> <ol style="list-style-type: none"> 1. Flush any dirty data in the Render Cache to memory. This is done by default, however this can be inhibited. 2. Invalidate the state and command cache. <p>Usage note: After this command is completed and followed by a Store DWord-type command, CPU access to graphics memory will be coherent (assuming the Render Cache flush is not inhibited). This command is specific to the render engine. Other engines use MI_FLUSH_DW</p> <p>[DevSNB]: This command is considered deprecated and will be removed completely in future projects. If it must still be used, enable bit 12 in the MI_MODE (0x209C) register</p> <p>Note that if no post-sync operation is enabled for Flush completion, a register write to DE scratch space will be generated by command streamer. Scratch space description is given in DE Specs.</p>

1.3.9 MI_NOOP

MI_NOOP		
Project:	All	Length Bias: 1
Engine:	Render	
<p>The MI_NOOP command basically performs a “no operation” in the command stream and is typically used to pad the command stream (e.g., in order to pad out a batch buffer to a QWord boundary). However, there is one minor (optional) function this command can perform – a 22-bit value can be loaded into the MI NOPID register. This provides a general-purpose command stream tagging ("breadcrumb") mechanism (e.g., to provide sequencing information for a subsequent breakpoint interrupt).</p> <p>Performance Note: On [Pre-DevSNB, Pre-DEVILK] The process time to execute a NOP command is min of 6 clock cycles. On [DEVILK] The NOP process time is reduced to 1 clock. One example usage of the improved NOP throughput is for some multi-pass media application whereas some unwanted media object commands are replaced by MI_NOOP without repacking the commands in a batch buffer.</p>		
DWord Bit	Description	
0	31:29	Command Type Default Value: 0h MI_COMMAND Format: OpCode
	28:23	MI Command Opcode Default Value: 0h MI_NOOP Format: OpCode

MI_NOOP			
22	Identification Number Register Write Enable Project: All Format: Enable This field enables the value in the Identification Number field to be written into the MI NOPID register. If disabled, that register is unmodified – making this command an effective “no operation” function.		
	Value Name	Description	Project
	0h	Disable	Do not write the NOP_ID register.
	1h	Enable	Write the NOP_ID register.
31:0	Identification Number Project: All Format: U22 This field contains a 22-bit number which can be written to the MI NOPID register.		

1.3.10 Surface Probing

These commands are only valid when the “Surface Fault Enable” bit is set in the GFX_MODE register

1.3.10.1 MI_PROBE

MI_PROBE		
Project:	All	Length Bias: 2
Engine:	Render	
<p>The probe command is inserted into a ring or batch buffer in order to validate the base address(es) of a surface(s) required by subsequent commands. When parsed, the probe command will do a “test” access of the surface base address to see if it is valid. The probe will also be written to the specified slot of a memory-based probe list such that it can be re-validated if the current context is switched out and then switched back in. If the test access encounters an invalid page table entry, it said to “fault”. Faulting probes will trigger the current context to be switched.</p> <p>A probe command containing multiple probes will process all of them regardless of which ones fault. If any probe faulted and the pipeline is busy, the next command (unless it is a probe or unprobe command) will stall until the pipeline drains. Once the pipeline is empty, the pending probes will be written to the probe list with the faulted probes indicated and a context switch will occur.</p> <p>Note that surfaces accessed through the global GTT need not be validated. It is assumed that Global GTT pages will not be invalidated while a context is switched out. Probe and unprobe are not privileged commands. The probe command can be used to insert only 512 probes in one command. Note that the total number of probes allowed in the system is 1024.</p>

	22:0	Reserved Project: All Format: MBZ

1.3.12 MI_SEMAPHORE_MBOX

MI_SEMAPHORE_MBOX		
Project:	All	Length Bias: 2
Engine:	Render	
<p>This command is provided as alternative to MI_SEMAPHORE to provide mailbox-type semaphores where there is no update of the semaphore by the checking process (the consumer). Single-bit compare-and-update semantics are also provided. In either case, atomic access of semaphores need not be guaranteed by hardware as with the previous command. This command should eventually supersede the previous command.</p> <p>Synchronization between contexts (especially between contexts running on 2 different engines) is provided by the MI_SEMAPHORE_MBOX command. Note that contexts attempting to synchronize in this fashion must be able to access a common memory location. This means the contexts must share the same virtual address space (have the same page directory), must have a common physical page mapped into both of their respective address spaces or the semaphore commands must be executing from a secure batch buffer or directly from a ring with the Use Global GTT bit set such that they are “privileged” and will use the (always shared) global GTT.</p> <p>MI_SEMAPHORE with the Update Semaphore bit <u>set</u> (and the Compare Semaphore bit <u>clear</u>) implements the <i>Signal</i> command, while the <i>Wait</i> command is indicated by Compare Semaphore being <u>set</u>. Note that <i>Wait</i> can cause a context switch. <i>Signal</i> increments unconditionally.</p>		
DWord Bit	Description	
0	31:29	Command Type Default Value: 0h MI_COMMAND Format: OpCode
	28:23	MI Command Opcode Default Value: 16h MI_SEMAPHORE_MBOX Format: OpCode
	22	Use Global GTT Project: All Format: U32 If set, this command will use the global GTT to translate the Semaphore Address and this command must be executing from a privileged (secure) batch buffer. If clear, the PPGTT will be used to translate the Semaphore Address . This bit will be ignored (and treated as if clear) if this command is executed from a non-privileged batch buffer. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer or directly from a ring buffer.
	21	Update Semaphore Project: All Format: U32 If set, the value from the Semaphore Data Dword is written to memory. If Compare Semaphore is also set, the semaphore is not updated if the semaphore comparison fails. If clear, the data at Semaphore Address is not changed.
	20	Compare Semaphore Project: All Format: U32 If set, the value from the Semaphore Data Dword is compared to the value from the Semaphore Address in memory. If the value at Semaphore Address is greater than the Semaphore Data Dword , execution is continued from the current command buffer. If clear, no comparison takes place. Update Semaphore <i>must</i> be set in this case.
	19	Reserved Project: All Format: MBZ

MI_SEMAPHORE_MBOX		
	18	Compare Register Project: All Format: Compare Type If set, data in MMIO register will be used for compare. If clear, data in memory will be used for compare.
	17	Register Select Project: All Format: Register Select If compare register is set in bit[18], this field indicate which register will be used. 0: VCS register (RVSYNC) 1: BCS register (RBSYNC)
	16:8	Reserved Project: All Format: MBZ
	7:0	DWord Length Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:0	Semaphore Data Dword Project: All Format: U32 Data dword to compare/update memory. The Data dword is supplied by software to control execution of the command buffer. If the compare is enabled and the data at Semaphore Address is greater than this dword, the execution of the command buffer continues.
2	31:2	PointerBitFieldName/MMIO Register Address Project: All Address: GraphicsVirtualAddress[31:2] Surface Type: Semaphore if Compare Register bit[18] is cleared, this field is the Graphics Memory Address of the 32 bit value for the semaphore. If Compare Register bit[18] is set, this field is the MMIO address of the register for the semaphore.
	1:0	Reserved Project: All Format: MBZ

1.3.13 MI_SET_CONTEXT

MI_SET_CONTEXT	
Project:	All
Engine:	Render
Length Bias:	2
<p>The MI_SET_CONTEXT command is used to specify the <i>logical</i> context associated with the hardware context. A logical context is an area in memory used to store hardware context information, and the context is referenced via a 2KB-aligned pointer. If the (new) logical context is different (i.e., at a different memory address), the device will proceed to save the current HW context values to the current logical context address, and then restore (load) the new logical context by reading the context from the new address and loading it into the hardware context state. If the logical context address specified in this command matches the current logical context address, this command is effectively treated as a NOP.</p> <p>This command also includes some controls over the context save/restore process. It is specific to the render engine</p> <ul style="list-style-type: none"> • The Force Restore bit can be used to refresh the on-chip device state from the same memory address if the indirect state buffers have been modified. • The Restore Inhibit bit can be used to prevent the new context from being loaded at all. This must be used to prevent an uninitialized context from being loaded. Once software has initialized a context (by setting all state variables to initial values via commands), the context can then be stored and restored normally. • This command needs to be always followed by a single MI_NOOP instruction to workaround a Gen4 silicon issue. • When switching from a generic media context to a 3D context, the generic media state must be cleared via the <i>Generic Media State Clear</i> bit 16 in PIPE_CONTROL (or bit 4 in MI_FLUSH) before saving 3D context.

	1	<p>Force Restore Project: All Format: U32</p> <p>When switching <u>to</u> this logical context a comparison between Logical Context Address and the contents of the CCID register is performed. Normally, matching addresses prevent a context restore from occurring; however, when this bit is set a context restore is forced to occur. This bit cannot be set with Restore Inhibit.</p> <p>Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.</p>												
	0	<p>Restore Inhibit Project: All Format: U32</p> <p>If set, the restore of the HW context from the logical context specified by Logical Context Address is inhibited (i.e., the existing HW context values are maintained). This bit must be used to prevent the loading of an uninitialized logical context. If clear, the context switch proceeds normally. This bit cannot be set with Force Restore.</p> <p>Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.</p>												

1.3.14 MI_STORE_DATA_IMM

MI_STORE_DATA_IMM												
Project:	All	Length Bias:	2									
Engine:	Render											
<p>The MI_STORE_DATA_IMM command requests a write of the QWord constant supplied in the packet to the specified Memory Address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).</p> <p>Programming Notes: This command should not be used within a “non-secure” batch buffer to access global virtual space. Doing so will cause the command parser to perform the write with byte enables turned off. This command can be used within ring buffers and/or “secure” batch buffers. This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers). This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete “eventually”, there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations.</p>

1.3.17.1 Description of Dedicated Performance Counters [A0-A28]

Cntr #	Event	Description
A0	Aggregated Core Array Active	The sum of all cycles on all cores spent actively executing instructions.
A1	Aggregated Core Array Stalled	The sum of all cycles on all cores spent stalled. (at least one thread loaded but the entire core is stalled for any reason)
A2	Vertex Shader Active Time	Total time in clocks the vertex shader spent active on all cores.
A3	Vertex Shader Stall Time	Total time in clocks the vertex shader spent stalled on all cores. This metric must be bucketed by stall type ("other" is ok – but must have buckets for things that are architecturally interesting)
A4	Vertex Shader Stall Time – Core Stall	Total time in clocks the vertex shader spent stalled on all cores – and the entire core was stalled as well. This metric must be bucketed by stall type ("other" is ok – but must have buckets for things that are architecturally interesting)
A5	Vertex Shader ready but not running Time	Total time in clocks the vertex shader spent ready to run but not running on all cores.
A6	Geometry Shader Active Time	Total time in clocks the geometry shader spent active on all cores.
A7	Geometry Shader Stall Time	Total time in clocks the geometry shader spent stalled on all cores. This metric must be bucketed by stall type ("other" is ok – but must have buckets for things that are architecturally interesting)
A8	Geometry Shader Stall Time – Core Stall	Total time in clocks the geometry shader spent stalled on all cores – and the entire core was stalled as well. This metric must be bucketed

Cntr #	Event	Description
		by stall type (“other” is ok – but must have buckets for things that are architecturally interesting)
A9	# GS threads loaded	Number of GS threads loaded at any given time in the EUs.
A10	Geometry Shader ready but not running Time	Total time in clocks the geometry shader spent ready to run but not running on all cores.
A11	Pixel Shader Active Time	Total time in clocks the pixel shader spent active on all cores.
A12	Pixel Shader Stall Time	Total time in clocks the Pixel shader spent stalled on all cores. This metric must be bucketed by stall type (“other” is ok – but must have buckets for things that are architecturally interesting)
A13	Pixel Shader Stall Time – Core Stall	Total time in clocks the pixel shader spent stalled on all cores – and the entire core was stalled as well. This metric must be bucketed by stall type (“other” is ok – but must have buckets for things that are architecturally interesting)
A14	# PS threads loaded	Number of PS threads loaded at any given time in the EUs.
A15	Pixel Shader ready but not running Time	Total time in clocks the Pixel shader spent ready to run but not running on all cores.
A16	Early Z Test Pixels Passing	Number of pixels/samples passing early Z test (i.e. before PS dispatch)
A17	Early Z Test Pixels Failing	Number of pixels/samples failing early Z test (i.e. before PS dispatch)
A18	Early Stencil Test Pixels Passing	Number of pixels/samples passing early stencil test (i.e. before PS dispatch)
A19	Early Stencil Test Pixels Failing	Number of pixels/samples failing early stencil test (i.e. before PS dispatch)
A20	Pixel Kill Count	Number of pixels/samples killed in the pixel shader. (How about chroma key?)

Cntr #	Event	Description
A21	Alpha Test Pixels Failed	Number of pixels/samples that fail alpha-test. Alpha to coverage may have some challenges in per-pixel invocation.
A22	Post PS Stencil Pixels Failed	Number of pixels/samples fail stencil test in the backend.
A23	Post PS Z buffer Pixels Failed	Number of pixels/samples fail Z test in the backend.
A24	Pixels/samples Written in the frame buffer	MRT case will report multiple of those.
A25	<i>GPU Busy</i>	CSunit indicating that ring is idle.
A26	<i>CL active and not stalled</i>	Clipper Fixed Function is active but not stalled
A27	<i>SF active and stalled</i>	SF Fixed Function is active but not stalled

1.3.18 MI_UPDATE_GTT

MI_UPDATE_GTT													
Project:	All												
Engine:	Render												
Length Bias:	2												
<p>The MI_UPDATE_GTT command is used to update GTT page table entries in a coherent manner and at a predictable place in the command flow.</p> <p>An MI_FLUSH should be placed before this command, since work associated with preceding commands that are still in the pipeline may be referencing GTT entries that will be changed by its execution. The flush will also invalidate TLBs and read caches that may become invalid as a result of the changed GTT entries. MI_FLUSH is not required if it can be guaranteed that the pipeline is free of any work that relies on changing GTT entries (such as MI_UPDATE_GTT contained in a paging DMA buffer that is doing only update/mapping activities and no rendering).</p> <p>This is a privileged command. This command will be converted to a no-op and an error flagged if it is executed from within a non-secure batch buffer.</p> <p>PPGTT updates cannot be done via MI_UPDATE_GTT, gfx driver will have to use storeDW for PPGTT inline updates.</p>													
DWord Bit	Description

16	<p>Overlay Flip Pending Wait Enable Project: BW,CL Format: Enable</p> <p>This field enables a wait for the duration of an Overlay “Flip Pending” condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new overlay address has been loaded into the corresponding overlay registers). See Overlay Flip Pending Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>												
16	<p>Display Sprite B Flip Pending Wait Enable Project: CTG+ Format: Enable</p> <p>This field enables a wait for the duration of a Display Sprite B “Flip Pending” condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>												
15	<p>Reserved Project: All Format: MBZ</p>												
14	<p>Display Pipe B H Blank Wait Enable Project: All Format: Enable</p> <p>This field enables a wait until the start of next Display Pipe B “Horizontal Blank” event occurs. This event is defined as the start of the next Display B Horizontal blank period. Note that this can cause a wait for up to a line. See Horizontal Blank Event in the Device Programming Interface chapter of <i>MI Functions</i>.</p>												
13	<p>Display Pipe A H Blank Wait Enable Project: All Format: Enable</p> <p>This field enables a wait until the start of next Display Pipe A “Horizontal Blank” event occurs. This event is defined as the start of the next Display A Horizontal blank period. Note that this can cause a wait for up to a line. See Horizontal Blank Event in the Device Programming Interface chapter of <i>MI Functions</i>.</p>												

MI_WAIT_FOR_EVENT

12:9	<p>Condition Code Wait Select Project: All</p> <p>This field enables a wait for the duration that the corresponding condition code is active. These enable select one of 15 condition codes in the EXCC register, that cause the parser to wait until that condition-code in the EXCC is cleared.</p> <table border="1" style="width: 100%;"> <thead> <tr> <th style="text-align: center;">Value Name</th> <th style="text-align: center;">Description</th> <th style="text-align: center;">Project</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0h</td> <td>Not Enabled</td> <td>Condition Code Wait not enabled</td> <td style="text-align: center;">All</td> </tr> <tr> <td style="text-align: center;">1h-5h</td> <td>Enabled</td> <td>Condition Code select enabled; selects one of 5 codes, 0 – 4</td> <td style="text-align: center;">All</td> </tr> <tr> <td style="text-align: center;">6h-15h</td> <td>Reserved</td> <td></td> <td style="text-align: center;">All</td> </tr> </tbody> </table> <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th style="text-align: left;">Programming Notes</th> <th style="text-align: center;">Project</th> </tr> </thead> <tbody> <tr> <td>Note that not all condition codes are implemented. The parser operation is UNDEFINED if an unimplemented condition code is selected by this field. The description of the EXCC register (<i>Memory Interface Registers</i>) lists the codes that are implemented.</td> <td style="text-align: center;">All</td> </tr> </tbody> </table>	Value Name	Description	Project	0h	Not Enabled	Condition Code Wait not enabled	All	1h-5h	Enabled	Condition Code select enabled; selects one of 5 codes, 0 – 4	All	6h-15h	Reserved		All	Programming Notes	Project	Note that not all condition codes are implemented. The parser operation is UNDEFINED if an unimplemented condition code is selected by this field. The description of the EXCC register (<i>Memory Interface Registers</i>) lists the codes that are implemented.	All
Value Name	Description	Project																		
0h	Not Enabled	Condition Code Wait not enabled	All																	
1h-5h	Enabled	Condition Code select enabled; selects one of 5 codes, 0 – 4	All																	
6h-15h	Reserved		All																	
Programming Notes	Project																			
Note that not all condition codes are implemented. The parser operation is UNDEFINED if an unimplemented condition code is selected by this field. The description of the EXCC register (<i>Memory Interface Registers</i>) lists the codes that are implemented.	All																			
8	<p>Display Plane C Flip Pending Wait Enable Project: BW,CL Format: Enable</p> <p>This field enables a wait for the duration of a Display Plane C “Flip Pending” condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>																			
8	<p>Display Sprite A Flip Pending Wait Enable Project: CTG+ Format: Enable</p> <p>This field enables a wait for the duration of a Display Sprite A “Flip Pending” condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>																			
7	<p>Display Pipe B Vertical Blank Wait Enable Project: All Format: Enable</p> <p>This field enables a wait until the next Display Pipe B “Vertical Blank” event occurs. This event is defined as the start of the next Display Pipe B vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event (See <i>Programming Interface</i>).</p> <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th style="text-align: left;">Programming Notes</th> <th style="text-align: center;">Project</th> </tr> </thead> <tbody> <tr> <td>Prior to using the MI_WAIT_FOR_EVENT command to wait on Display Pipe A/B VBlank events, the corresponding Vertical Blank Interrupt Enable (bit 17) of the corresponding PIPEASTAT (70024h) or PIPEBSTAT (71024h) register must be set. Note that this does not require an actual VBlank interrupt to be enabled.</td> <td style="text-align: center;">All</td> </tr> </tbody> </table>	Programming Notes	Project	Prior to using the MI_WAIT_FOR_EVENT command to wait on Display Pipe A/B VBlank events, the corresponding Vertical Blank Interrupt Enable (bit 17) of the corresponding PIPEASTAT (70024h) or PIPEBSTAT (71024h) register must be set. Note that this does not require an actual VBlank interrupt to be enabled.	All															
Programming Notes	Project																			
Prior to using the MI_WAIT_FOR_EVENT command to wait on Display Pipe A/B VBlank events, the corresponding Vertical Blank Interrupt Enable (bit 17) of the corresponding PIPEASTAT (70024h) or PIPEBSTAT (71024h) register must be set. Note that this does not require an actual VBlank interrupt to be enabled.	All																			
6	<p>Display Plane B Flip Pending Wait Enable Project: All Format: Enable</p> <p>This field enables a wait for the duration of a Display Plane B “Flip Pending” condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of <i>MI Functions</i>).</p>																			

MI_WAIT_FOR_EVENT

5	<p>Display Pipe B Scan Line Window Wait Enable Project: All Format: Enable</p> <p>This field enables a wait while a Display B “In Scan Line Window” condition exists. This condition is defined as the period of time the Display B refresh is inside the scan line window as specified by a previous MI_LOAD_SCAN_LINES_INCL or MI_LOAD_SCAN_LINES_EXCL command. If the Display B refresh is outside this window, or a window has not been specified, the parser proceeds, treating this command as a no-op. If the Display B refresh is currently inside this window, the parser will wait until the refresh exits the window. See Scan Line Window Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>				
4	<p>Frame Buffer Compression Idle Wait Enable Project: All Format: Enable</p> <p>This field enables a wait while the Frame Buffer compressor is busy. The ring that this command got executed from is removed from arbitration for the wait period and is inserted into arbitration as soon as the frame buffer compressor is idle.</p>				
3	<p>Display Pipe A Vertical Blank Wait Enable Project: All Format: Enable</p> <p>This field enables a wait until the next Display Pipe A “Vertical Blank” event occurs. This event is defined as the start of the next Display A vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event in the Device Programming Interface chapter of <i>MI Functions</i>.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Programming Notes</th> <th style="text-align: left;">Project</th> </tr> </thead> <tbody> <tr> <td>Prior to using the MI_WAIT_FOR_EVENT command to wait on Display Pipe A/B VBlank events, the corresponding Vertical Blank Interrupt Enable (bit 17) of the corresponding PIPEASTAT (70024h) or PIPEBSTAT (71024h) register must be set. Note that this does not require an actual VBlank interrupt to be enabled.</td> <td>All</td> </tr> </tbody> </table>	Programming Notes	Project	Prior to using the MI_WAIT_FOR_EVENT command to wait on Display Pipe A/B VBlank events, the corresponding Vertical Blank Interrupt Enable (bit 17) of the corresponding PIPEASTAT (70024h) or PIPEBSTAT (71024h) register must be set. Note that this does not require an actual VBlank interrupt to be enabled.	All
Programming Notes	Project				
Prior to using the MI_WAIT_FOR_EVENT command to wait on Display Pipe A/B VBlank events, the corresponding Vertical Blank Interrupt Enable (bit 17) of the corresponding PIPEASTAT (70024h) or PIPEBSTAT (71024h) register must be set. Note that this does not require an actual VBlank interrupt to be enabled.	All				
2	<p>Display Plane A Flip Pending Wait Enable Project: All Format: Enable</p> <p>This field enables a wait for the duration of a Display Plane A “Flip Pending” condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>				
1	<p>Display Pipe A Scan Line Window Wait Enable Project: All Format: Enable</p> <p>This field enables a wait while a Display Pipe A “In Scan Line Window” condition exists. This condition is defined as the period of time the Display A refresh is inside the scan line window as specified by a previous MI_INCLUSIVE_SCAN_WINDOW or MI_EXCLUSIVE_SCAN_WINDOW command. If the Display A refresh is outside this window, or a window has not been specified, the parser proceeds, treating this command as a no-op. If the Display A refresh is currently inside this window, the parser will wait until the refresh exits the window. See Scan Line Window Condition in the Device Programming Interface chapter of <i>MI Functions</i>.</p>				
0	<p>Reserved Project: All Format: MBZ</p>
